TODO-001	1.4	Team Objective and Development Overview

Changes to the TODO were made throughout the whole document. There were general changes in the project background portion to clarify a general use case for the radar unit. The majority of our changes were made to the requirements matrix and the key success measures. On the requirements matrix we consolidated many of our previous market requirements and moved some of them to be performance measures. We ensured that the performance measures were not in a one to one relationship with the market requirements and that they were more descriptive. The updated performance measures include values which have been more carefully thought out. The key success measures were revised to give the team a better idea on how an excellent product will be defined. The performance values were defined to more accurately describe our desired operation. Following feedback from Mark we got rid of the key success measure which deals with angular deviation. He felt that we were trying to achieve functionality that wasn't necessary. We added descriptive paragraphs following the key success measure matrix. Other changes were made to clean up grammar and spelling errors.
